Problem - Uneven Concrete

Settled concrete happens everywhere. Most commonly, sidewalks, patios, and driveways are affected. This can result in uneven walkways, trip hazards, and improperly sloped concrete.

Before

Solution - Polyjacking

A simple process for lifting the settled concrete involves injecting an expanding foam under the slab. This is accomplished by drilling dime-sized holes in the concrete and injecting through access ports. After lifting, the holes are cemented over with the same dust that was created when we drilled them, helping to blend in the repair.
